

# Gestion de Projet et Génie Logiciel

## Master 1, Lyon 1

Matthieu Moy

UCBL

2018-2019

# Outline

- 1 Course Introduction
- 2 Software Engineering: Why?
- 3 Software Engineering: How
- 4 Software Lifecycle
- 5 Principles, Methods, Practices
- 6 Tooling

# Objectives

- Software engineering (Génie Logiciel): the art of making “good” software, at reasonable price
- Project management: what’s left, other than development? (need analysis & specification, team management, ...)
- Approach:
  - ▶ Good practices: tests, design patterns, ...
  - ▶ Tooling: continuous integration, version control, unit testing, ...
  - ▶ Organization: project lifecycle, agile methods
  - ▶ Speakers from several external companies
- Many notions usable directly  $\Rightarrow$  apply in your school project, your company (apprentices), ...

# Practical Aspects

- **Course material:**

`https://forge.univ-lyon1.fr/matthieu.moy/mlif01`

- ▶ In your web browser

- ▶ `git clone`

`https://forge.univ-lyon1.fr/matthieu.moy/mlif01`  
once, `git pull` periodically.

- ▶ Slides, exercises, labs, examples of code

- **Evaluation:**

- ▶ Final exam

- ▶ Mini-project: deadline = Oct 6th 2018, 20:00 (TOMUSS)

- **Schedule: see ADE**

# Assumed to be Previously Learnt

- **Object-Oriented Programming basics:**

[http://tabard.fr/courses/2015/mif17/2015/MIF17\\_Rappel\\_objet.pdf](http://tabard.fr/courses/2015/mif17/2015/MIF17_Rappel_objet.pdf)

- **UML Modeling basics:**

- ▶ **Class diagrams (classes, object, package, etc.):**

<http://tabard.fr/courses/2015/mif17/2015/UML-Statique.pdf>

- ▶ **Dynamic diagrams (sequence, state-machine):**

<http://tabard.fr/courses/2015/mif17/2015/UML-Dynamique.pdf>

# Outline

- Generalities (today, tomorrow)
- Tools for code management
- Use-cases
- Agile methods
- Design-patterns
- Tests
- Ethics
- Project management

# Distribution

- 8×2h Lecture (CM)
- 2×2h Tutorial (TD)
- 5×2h Labs (TP)

# Outline

- 1 Course Introduction
- 2 Software Engineering: Why?**
- 3 Software Engineering: How
- 4 Software Lifecycle
- 5 Principles, Methods, Practices
- 6 Tooling

# Outline of this section

## 2 Software Engineering: Why?

- What we want ...
- What we do ...

# Quality Criteria for Software

- Some criteria for the user

- Reliable** Gives the expected result,

- Robust** Doesn't crash, behaves reasonably in unexpected conditions,

- Efficient** Gives the result quickly,

- User-friendly** Easy to use,

- Secure** Ability to resist to malicious uses.

# Quality Criteria for Software

- Criteria for the developer

**Readable** Easy to read, to understand. Well documented,

**Maintainable** Easy to modify, to fix,

**Portable** Runs on various systems,

**Extensible** Easy to improve,

**Reusable** Can be adapted to other applications.

# Outline of this section

## 2 Software Engineering: Why?

- What we want ...
- What we do ...

# Software Crisis

Cost of software is always important and higher than expected.

- Success of projects (Standish group, CHAOS Summary 2014):

	Number of projects
Abandonned, never used	31%
Late, over budget, incomplete	52%
On time and on budget	16%

- Usage of features (Waste In Software Projects,

<http://thecriticalpath.info/2011/07/07/waste-in-software-projects/>):

Use of features	Number of features
Never used	45%
Rarely used	19%
Sometimes	16%
Often	13%
Always	7%

# Why is it so hard?

Software development is easy:

<https://www.flickr.com/photos/jacobavanzato/16152519186>

# Why is it so hard?

A first prototype is easy to get ...

<https://www.flickr.com/photos/78044378@N00/364003706>

# Why is it so hard?

... but how do we extend it? How do we scale?

<https://www.flickr.com/photos/10402746@N04/7165270428>

# Scale? How big?

- Typical lab work = 100 LOC
- Typical school project = 1000 LOC

# Scale? How big?

- Typical lab work = 100 LOC
- Typical school project = 1000 LOC
- 100 developers, 100 LOC/day<sup>1</sup>, 10 years = 20 MLOC

---

<sup>1</sup>Optimistic estimate, e.g. COCOMO model estimates to 10-20 LOC/day  
⇒ > 10 \$/LOC ...

# Scale? How big?

- Typical lab work = 100 LOC
- Typical school project = 1000 LOC
- 100 developers, 100 LOC/day<sup>1</sup>, 10 years = 20 MLOC
- Linux Kernel 4.13: 20 MLOC
- Facebook: 60 MLOC
- Windows: 3 million *files*

---

<sup>1</sup>Optimistic estimate, e.g. COCOMO model estimates to 10-20 LOC/day  
⇒ > 10 \$/LOC ...

# Scale? How big?

- Typical lab work = 100 LOC
- Typical school project = 1000 LOC
- 100 developers, 100 LOC/day<sup>1</sup>, 10 years = 20 MLOC
- Linux Kernel 4.13: 20 MLOC
- Facebook: 60 MLOC
- Windows: 3 million *files*
- Google's full codebase: 2 *Billion* LOC

Nice visualization:

<https://informationisbeautiful.net/visualizations/million-lines-of-code/>

---

<sup>1</sup>Optimistic estimate, e.g. COCOMO model estimates to 10-20 LOC/day  
⇒ > 10 \$/LOC ...

# Scale? How big?

- Typical lab work = 100 LOC
- Typical school project = 1000 LOC
- 100 developers, 100 LOC/day<sup>1</sup>, 10 years = 20 MLOC
- Linux Kernel 4.13: 20 MLOC

- Windows: 3 million *files*
- Google's full codebase: 2 *Billion* LOC

Nice visualization:

<https://informationisbeautiful.net/visualizations/million-lines-of-code/>

↪ Not all programs are that big, but most programs are orders of magnitude bigger than what you've experienced so far.

---

<sup>1</sup>Optimistic estimate, e.g. COCOMO model estimates to 10-20 LOC/day  
⇒ > 10 \$/LOC ...

# How buggy is it?

“Industry Average: about 15 – 50 errors per 1000 lines of delivered code.”

“Microsoft Applications: about 10 – 20 defects per 1000 lines of code during in-house testing, and 0.5 defect per KLOC in production.”

(Source: Steve McConnell book, “Code Complete”)

# A few Famous Bugs

- Therac-25: radiotherapy machine **killed** at least 6 persons

<http://cr4.globalspec.com/blogentry/19025/Failure-of-the-Therac-25-Medical-Linear-Accelerator>

- Ariane 5 crash: **arithmetic overflow**  $\Rightarrow$  self-destruction of the shuttle  $\Rightarrow$  most expensive firework ever ( $\approx 500$  M\$). Ironically: well-tested software (re-used from Ariane 4), hardware redundancy (both computers crashed).

<http://www-users.math.umn.edu/~arnold/disasters/ariane.html>

- Mont Saint-Odile's crash: "the pilots inadvertently left the autopilot set in Vertical Speed mode (instead of Flight Path Angle mode) then entered "33" for "3.3<sup>0</sup> descent angle", which for the autopilot meant a descent rate of 3,300 feet (1,000 m) per minute."  $\Rightarrow$  a **UI** bug that costed 87 lives.

[https://en.wikipedia.org/wiki/Air\\_Inter\\_Flight\\_148](https://en.wikipedia.org/wiki/Air_Inter_Flight_148)

- Mars Climate Orbiter: "software which produced output in non-SI units of **pound-force** seconds (lbf-s) instead of the SI units of **newton**-seconds (N-s) specified in the contract between NASA and Lockheed"  $\Rightarrow$  Incorrect interpretation of specification =  $\approx 300$ M\$ crash

[https://en.wikipedia.org/wiki/Mars\\_Climate\\_Orbiter](https://en.wikipedia.org/wiki/Mars_Climate_Orbiter)

OK, these were critical systems. I just write ERPs/Accounting software

OK, these were critical systems. I just write ERPs/Accounting software

Well, you're in the game too!

# Louvois: paiement system for french militaries

- “Pendant près de **7 ans**, de nombreux soldats français ont vécu l'enfer. Non pas sur le terrain mais à cause de leur fiche de paie”
  - Started in 2011, affected 120,000 employees.
  - Over and under-payments.
  - More complex than it seems: 174 different kinds of bonus
  - “**C’était courru d’avance**”, “De 150 points de vérification, on est passé à 15 **pour tenir les délais**”
  - ⇒ complete rewrite decided. No fix available/possible.
  - “Un logiciel nouveau comme ça, il faut au moins trois ans pour l’installer”, “Il y aura donc bien **un an de retard**, et peut-être plus si l’on en croit d’autres sources.”, “On prévoit le lancement au 1er janvier 2019”
- ⇒ Not just “one unfortunate bug”: a 7-years failure due to initial bad management choices.

# Failure of “Agile” Contract at Macif

Alors qu’elle était plaignante, la Macif vient d’être condamnée à payer à un éditeur de logiciel 1.45 millions d’euros” (et 4 ans de développement).

[https:](https://www.linkedin.com/pulse/saffranchir-du-cycle-en-v-agile-canada-dry-ou-comment-maxime-blanc)

[//www.linkedin.com/pulse/saffranchir-du-cycle-en-v-agile-canada-dry-ou-comment-maxime-blanc](https://www.linkedin.com/pulse/saffranchir-du-cycle-en-v-agile-canada-dry-ou-comment-maxime-blanc)

# Outline

- 1 Course Introduction
- 2 Software Engineering: Why?
- 3 Software Engineering: How**
- 4 Software Lifecycle
- 5 Principles, Methods, Practices
- 6 Tooling

# Keep in Mind ...

- ❶ Computer systems are complex and require good methods
- ❷ Methods must combine rigor and adaptation to unknown and to change

# UML Modeling?

- Modeling:
  - ▶ Helps informal discussions between developers (e.g. quick and dirty diagrams on white board)
  - ▶ Helps rigorous specifications
  - ▶ Helps deriving implementation (manually or automatic)
- Modeling is not sufficient:
  - ▶ Need for design and programming techniques
  - ▶ Write readable and reusable code

# Outline

- 1 Course Introduction
- 2 Software Engineering: Why?
- 3 Software Engineering: How
- 4 Software Lifecycle**
- 5 Principles, Methods, Practices
- 6 Tooling

# Outline of this section

- 4 Software Lifecycle
  - Stages in the Lifecycle
  - Software Lifecycle Modeling

# Software Lifecycle

- Requirement analysis and definition
- Analysis and design
- Coding/Debugging
- Validation
- Evolution and Maintenance

# Software Lifecycle

- Requirement analysis and definition
  - ▶ specifications
  - ▶ feasibility study (may involve a prototype)

# Software Lifecycle

- Analysis and design

- ▶ Specification
- ▶ Architecture (= hard-to-change decisions)
- ▶ Detailed design (algorithms, data-structures)

# Software Lifecycle

- Coding

# Software Lifecycle

- Validation: make sure the program “works”
  - ▶ Static analysis and proof
  - ▶ Code review (very efficient)
  - ▶ Tests (essential)

# Software Lifecycle

- Evolution and maintenance:
  - ▶ Corrective maintenance (Bug fixing)
  - ▶ Adaptive maintenance (Porting, ...)
  - ▶ Evolutionary maintenance (New features, ...)

# Software Lifecycle

- Evolution and maintenance:
  - ▶ Corrective maintenance (Bug fixing)
  - ▶ Adaptive maintenance (Porting, ...)
  - ▶ Evolutionary maintenance (New features, ...)

“Always code as if the guy who ends up maintaining your code will be a violent psychopath

# Software Lifecycle

- Evolution and maintenance:
  - ▶ Corrective maintenance (Bug fixing)
  - ▶ Adaptive maintenance (Porting, ...)
  - ▶ Evolutionary maintenance (New features, ...)

“Always code as if the guy who ends up maintaining your code will be a violent psychopath who knows where you live.”

# Effort distribution

<http://users.jyu.fi/~koskinen/smcosts.htm>

## ● Part of Maintenance in Total Cost:

⇒ better optimize for maintainability than for initial development

# Effort distribution in Initial Development

As a rule of thumb ...

- Initial development:
  - ▶ Requirement analysis, architectural design:
  - ▶ Coding, debugging:
  - ▶ Validation:

# Effort distribution in Initial Development

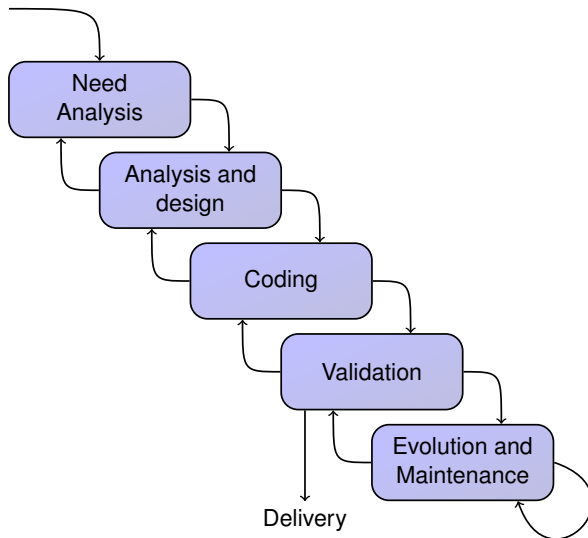

As a rule of thumb ...

- Initial development:
  - ▶ Requirement analysis, architectural design: 40%
  - ▶ Coding, debugging: 20%
  - ▶ **Validation: 40%**

# Outline of this section

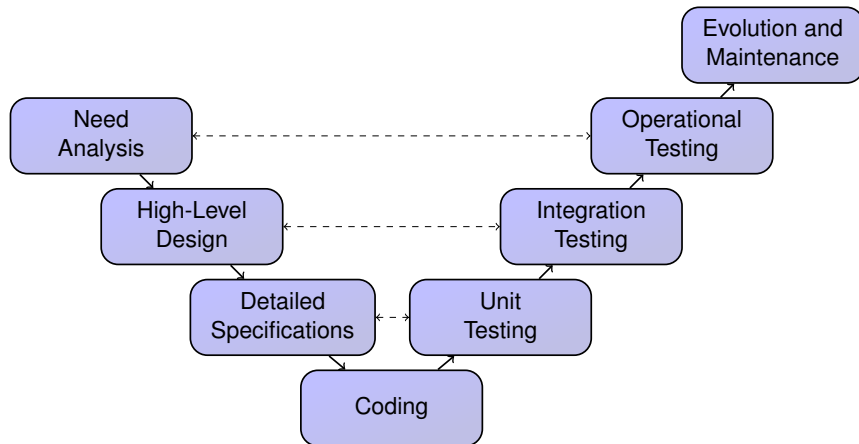

- 4 Software Lifecycle
  - Stages in the Lifecycle
  - **Software Lifecycle Modeling**
    - Waterfall Lifecycle
    - Incremental Lifecycle

# Waterfall Lifecycle

# V Lifecycle

## Variant of the Waterfall Lifecycle

# Waterfall/V Lifecycle

- Guiding principle: Interactions occur only between two successive states.
- Advantages:
  - ▶ Clean design (hopefully), no evolution within initial development.
  - ▶ Contractualization: specifications and effort estimates are known (hopefully) early
- Drawbacks:
  - ▶ Defect in first steps can have catastrophic consequences
  - ▶ Validation of specification late in the design
  - ▶ Integration late in the cycle  $\Rightarrow$  most risks eliminated late
  - ▶ Hardly parallelizable
  - ▶ Perfect in theory, but not adapted to humans?

# Waterfall/V Lifecycle

- Guiding principle: Interactions occur only between two successive states.
- Advantages:
  - ▶ Clean design (hopefully), no evolution within initial development.
  - ▶ Contractualization: specifications and effort estimates are known (hopefully) early
- Drawbacks:
  - ▶ Defect in first steps can have catastrophic consequences
  - ▶ Validation of specification late in the design
  - ▶ Integration late in the cycle  $\Rightarrow$  most risks eliminated late
  - ▶ Hardly parallelizable
  - ▶ Perfect in theory, but not adapted to humans?
- Variant: de-risk with “W”-lifecycle

“The management question, therefore, is not whether to build a pilot system and throw it away. You *will* do that. [...] Hence *plan to throw one away; you will, anyhow.*” (The Mythical Man-Month, 1975, Brooks)

# Incremental Lifecycle

# Spiral Lifecycle

Another view of the Incremental Lifecycle

# Incremental Lifecycle

- Guiding principle: divide the program in small amounts of analyzed, coded, and tested features.
- Advantages:
  - ▶ Early discovery of problems,
  - ▶ Early availability of prototypes (essential to get feedback from the client),
  - ▶ Helps continuous validation,
  - ▶ Allows time-based releases, as opposed to feature-based releases.

# Specifying the increment

- Informally
- With a subset of the specification (if it exists)
- With a use-case (or “user story”)
- With a set of tests

# Specifying the increment

- Informally
- With a subset of the specification (if it exists)
- With a use-case (or “user story”)
- With a set of tests

⇒ Test Driven Development

while true loop

    write tests

    make sure they don't pass

    implement feature

    debug until test pass

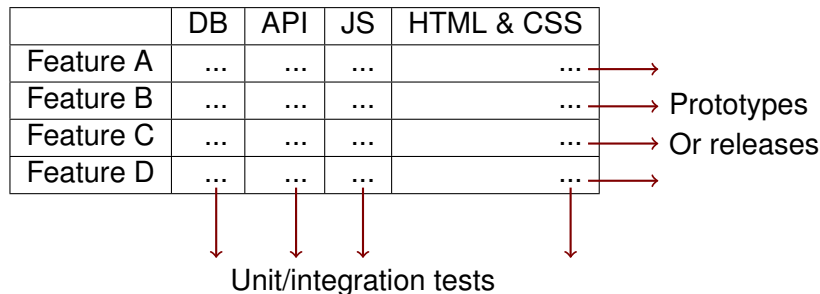

    commit and push

end loop

# Planning and Architecture with Iterative Development

Example with a typical web application: each feature may need entries in the database, modification to an internal REST API, JavaScript for the client-side logic and HTML&CSS for rendering.

# Planning and Architecture with Iterative Development

Example with a typical web application: each feature may need entries in the database, modification to an internal REST API, JavaScript for the client-side logic and HTML&CSS for rendering.

Layer-by-layer  $\rightsquigarrow$  First usable prototype after  $\approx 90\%$  work is done

# Planning and Architecture with Iterative Development

Example with a typical web application: each feature may need entries in the database, modification to an internal REST API, JavaScript for the client-side logic and HTML&CSS for rendering.

Layer-by-layer  $\rightsquigarrow$  First usable prototype after  $\approx 90\%$  work is done  
Feature-by-feature  $\rightsquigarrow$  Prototypes/releases available all along development

# Outline

- 1 Course Introduction
- 2 Software Engineering: Why?
- 3 Software Engineering: How
- 4 Software Lifecycle
- 5 Principles, Methods, Practices**
- 6 Tooling

# Organize the Work

- **Principles:** general guideline. Examples:
  - ▶ “Our highest priority is to satisfy the customer[...]” (Agile Manifesto)
  - ▶ “every module or class should have responsibility over a single part of the functionality provided by the software” (Single Responsibility Principle)
  - ▶ “The process of developing software consists of a number of phases.” (Software Development Life Cycle common principles)
- **Practices:** concrete things one can do. Examples:
  - ▶ Pair Programming
  - ▶ Test Driven Development
  - ▶ Code Review
  - ▶ Refactoring
  - ▶ DevOps
- **Methods/methodologies:** set of practices and how they are organized. Examples:
  - ▶ Waterfall
  - ▶ Merise ( $\approx$  ancestor of UML)
  - ▶ Scrum

# Principles? Practices? Methods?

How to (not) Get the Best of it

- You may agree with principles and dislike the associated method
- Good practices of one method may apply to other methods
- Applying a method without understanding its principles is doomed<sup>2</sup>
- No silver bullet: a method that works in a context may fail in another
- A successful method needs/attracts consultants to train people on this method  $\Rightarrow$  creates business  $\Rightarrow$  creates marketing.

---

<sup>2</sup>Remember the Macif example above?

# Methods in Software Engineering

- Main classes of methods:
  - ▶ Strategic management methods
  - ▶ Development methods
  - ▶ Project management methods
  - ▶ Quality assurance and control methods
- Development methods to:
  - ▶ Build operational systems
  - ▶ Organize the work
  - ▶ Manage the project's lifecycle
  - ▶ Manage costs
  - ▶ Manage risks
  - ▶ Get repeatable results

# Evolution of methods

4 successive trends:

- Modeling by functions
- Modeling by data
- Object-oriented modeling
- Agile methods

# 1st generation: function-based modeling

- Decompose a problem into sub-problems: functions, sub-functions, ...
- Each function defines inputs and outputs
- Examples: IDEF0, SADT
- When one function changes, everything may change

## 2nd generation: data-based modeling

- “Systemic” approaches
- Information system = structure + behavior
- Model the data, how they are organized (e.g. UML entity-relationship diagrams, MERISE).
- Data-modeling important with (R)DBMS.
- Behavior modeled separately
- Strengths:
  - ▶ Data consistency, abstraction levels well-defined
- Weaknesses:
  - ▶ Lack of consistency between data and behavior
  - ▶ Pushes towards long lifecycles (V)

## 3rd generation: object-oriented modeling

- “Systemic” approaches with data/processing consistency
- Set of objects that collaborate, considered statically (what the system is: data) and dynamically (what the system does: functions).
- Functional evolution possible without changing the data
- Modularity through abstraction and encapsulation

# Current trend: agile/adaptive ( $\neq$ predictive) methods

- Short iterations (e.g. demonstrate new features to the client every week)
- Strong and continuous interaction with client
- Value responding to change over following a plan
- Self-organized teams
- Adaptive: retrospective and adaptation periodically

# Outline

- 1 Course Introduction
- 2 Software Engineering: Why?
- 3 Software Engineering: How
- 4 Software Lifecycle
- 5 Principles, Methods, Practices
- 6 Tooling**

# Tools ...

- Necessary for development (compiler, text editor)
- Catch mistakes early (tests, code analysis)
- Automate stuff (I'm lazy, too)

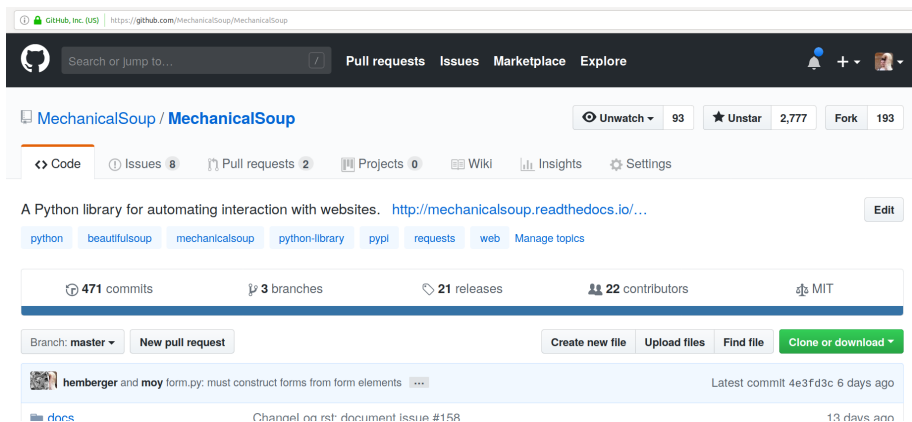

# A Small Example: MechanicalSoup (Python library)

Disclaimer: I'm one of the authors

- Small library (400 LOC of Python + 1000 LOC of tests) for browsing websites
- Small, developed on free-time  $\Rightarrow$  no planning, no real methodology
- Tries to follow best practices and uses many fun tools
- Let's go through a few of them... (you can do similar things with Lyon1's GitLab)

# Hosting: Git, GitHub

# Documentation automatically generated at each push

The screenshot shows a web browser displaying the MechanicalSoup documentation. The left sidebar contains a navigation menu with the following items: MechanicalSoup (with a home icon), stable, Search docs, Introduction, MechanicalSoup tutorial, The mechanicalsoup package: API documentation (expanded), StatefulBrowser (highlighted), Browser, Form, Exceptions, Frequently Asked Questions, External Resources, and Release Notes. The main content area is titled "StatefulBrowser" and contains the following information:

- Class Definition:** `class mechanicalsoup.StatefulBrowser(*args, **kwargs)`
- Bases:** `mechanicalsoup.browser.Browser`
- Description:** An extension of `Browser` that stores the browser's state and provides many convenient functions for interacting with HTML elements. It is the primary tool in MechanicalSoup for interfacing with websites.
- Parameters:**
  - session** – Attach a pre-existing requests Session instead of constructing a new one.
  - soup\_config** – Configuration passed to BeautifulSoup to affect the way HTML is parsed. Defaults to `{'features': 'lxml'}`. If overridden, it is highly recommended to **specify a parser**. Otherwise, BeautifulSoup will issue a warning and pick one for you, but the parser it chooses may be different on different machines.
  - requests\_adapters** – Configuration passed to requests, to affect the way HTTP requests are performed.
  - raise\_on\_404** – If True, raise `LinkNotFoundError` when visiting a page triggers a 404 Not Found error.
  - user\_agent** – Set the user agent header to this value.
- Forwarding:** All arguments are forwarded to `Browser()`.

# About pull-requests and checks ...

- Anyone can submit a pull-request
- Pull-requests trigger build + testsuite + coverage check + style check + static analysis
  - ▶ Test failing  $\Rightarrow$  fail
  - ▶ Incompatibility with one supported version of Python  $\Rightarrow$  fail
  - ▶ Incorrect style (lines >80 characters, mis-placed space, ...)  $\Rightarrow$  fail
  - ▶ Line of code not covered by a test  $\Rightarrow$  fail
  - ▶ Bad pattern detected by code analysis  $\Rightarrow$  fail
- How we did all that? Mainly “use tools/services” and 30-lines long `.travis.yml` file.

# Automated testing

(Because life it too short to spend time on manual testing)

- Code that tests code:

```
def test_no_404(httpbin):  
    browser = mechanicalsoup.StatefulBrowser()  
    resp = browser.open(httpbin + "/nosuchpage")  
    assert resp.status_code == 404
```

- General form of automated tests:

```
def name_of_test_function():  
    # given  
    some_object = ...  
    # when  
    some_object.some_action(...)  
    # then  
    assert ...
```

# Next Course: More on Tooling

- Build a complex Java project with gazillions of dependencies without pain
- Discover the awesomeness of GitLab
- Apply in your lab works!
